The parasites inhabit to the common and hepatic bile ducts where they cause significant pathology of the liver, particularly involving the bile ducts. Liver fluke eggs will reach the environment via the sphincter of ampulla into the duodenum and they are excreted with human feces.

### **Bing: The Biology Of Parasites**

Molecular analysis of parasitic organisms has been remarkably productive in revealing unusual and unexpected pathways of gene expression. The chapter discusses trypanosomatids as “representative” protozoans and nematodes as “representative” helminths. These organisms yield biochemical insight into parasite gene expression.

Parasitism is a form of symbiosis in which one organism (called parasite) benefits at the expense of another organism usually of different species (called host). This host-parasite association may eventuate to the injury of the host. Parasites can

cause harm or disease to their host. They are generally much smaller than their hosts.

### **Parasitism - Wikipedia**

In humans, the parasites grow and multiply first in the liver cells and then in the red cells of the blood. In the blood, successive broods of parasites grow inside the red cells and destroy them, releasing daughter parasites (“merozoites”) that continue the cycle by invading other red cells.

Parasites may be characterized as ectoparasites—including ticks, fleas, leeches, and lice—which live on the body surface of the host and do not themselves commonly cause disease in the host; or endoparasites, which may be either intercellular (inhabiting spaces in the host’s body) or intracellular (inhabiting cells in the host’s body).

For 40 years, the Biology of Parasitism (BoP) Course has served a critical role in

training the next generation of parasitologists: bringing bright, motivated students together with outstanding and committed faculty to create a stimulating environment for interaction, education and discovery.

A parasite is an organism drawing nutrients from a living host. It lives in or on another organism, getting from it part or all of its food. It usually shows some degree of adaptive modification, and causes some degree of damage to its host.

Parasitism is a type of symbiotic relationship, or long-term relationship between two species, where one member, the parasite, gains benefits that come at the expense of the host member. The word parasite comes from the Latin form of the Greek word παράσιτος (parasitos), meaning “one who eats at the table of another”.

In evolutionary ecology, parasitism is a symbiotic relationship between species,

where one organism, the parasite, lives on or in another organism, the host, causing it some harm, and is adapted structurally to this way of life. The entomologist E. O. Wilson has characterised parasites as "predators that eat prey in units of less than one".
